AHP-Based Surface Disinfectant

- Advantages
  - 1 min bactericidal (VRE, MRSA) and virucidal claim
  - 5 min mycobactericidal claim
  - Safe for workers, environment
  - Good cleaner
  - EPA (0.6% RTU, wet wipe)
- Disadvantage
  - Cost (RTU $5.80/32oz/pt, $92.83/512oz/gal; RTU QUAT $3.21/32oz/pt)

Disinfection and Sterilization of Emerging Pathogens

- Hepatitis C virus
- Clostridium difficile
- Cryptosporidium
- Helicobacter pylori
- E.coli 0157:H7
- Antibiotic-resistant microbes (MDR-TB, VRE, MRSA)
- SARS Coronavirus, avian influenza, norovirus, prions
- Bioterrorism agents (anthrax, plague, smallpox)
C. difficile spores

Environmental Contamination
C. difficile

- 25% (117/466) of cultures positive (<10 CFU) for C. difficile. >90% of sites positive with incontinent patients. Samore et al. Am J Med 1996;100:32.
- 9.3% (85/910) of environmental cultures positive (floors, toilets, toilet seats) for C. difficile. Kim et al. J Inf Dis 1981;143:42.
- 29% (62/216) environmental samples were positive for C. difficile. 8% (7/88) culture-negative patient, 29% (11/38) positive cultures in rooms occupied by asymptomatic patients and 49% (44/90) in rooms with patients who had CDAD. NEJM 1989;320:204
- 10% (110/1086) environmental samples were positive for C. difficile in case-associated areas and 2.5% (14/489) in areas with no known cases. Fekety et al. Am J Med 1981;70:907.
Role of the Environment

*C. difficile*

  - 0-25% environmental sites positive-0% hand cultures positive
  - 26-50% environmental sites positive-8% hand cultures positive
  - >50% environmental sites positive-36% hand cultures positive
- 59% of 35 HCWs were *C. difficile* positive after direct contact with culture-positive patients.
- *C. difficile* incidence data correlated significantly with the prevalence of environmental *C. difficile*. Fawley et al. Epid Infect 2001;126:343.

Disinfectants and Antiseptics

*C. difficile* spores at 20 min, Rutala et al, 2006

- No measurable activity (1 *C. difficile* strain, J9)
  - CHG
  - Vesphen (phenolic)
  - 70% isopropyl alcohol
  - 95% ethanol
  - 3% hydrogen peroxide
  - Clorox disinfecting spray (65% ethanol, 0.6% QUAT)
  - Lysol II disinfecting spray (79% ethanol, 0.1% QUAT)
  - TBQ (0.06% QUAT); QUAT may increase sporulation capacity - Lancet 2000;356:1324
  - Novaplus (10% povidone iodine)
  - Accel (0.5% hydrogen peroxide)
Disinfectants and Antiseptics
*C. difficile* spores at 10 and 20 min, Rutala et al, 2006

- ~4 $\log_{10}$ reduction (5 *C. difficile* strains including BI-9)
  - Clorox, 1:10, ~6,000 ppm chlorine (but not 1:50, ~1,200 ppm)
  - Clorox Clean-up, ~1,910 ppm chlorine
  - Tilex, ~25,000 ppm chlorine
  - Steris 20 sterilant, 0.2% peracetic acid
  - Cidex, 2.4% glutaraldehyde
  - Cidex-OPA, 0.55% OPA
  - Wavicide, 2.65% glutaraldehyde
  - Aldahol, 3.4% glutaraldehyde and 26% alcohol

Control Measures
*C. difficile*

- Handwashing (soap and water), contact precautions, and meticulous environmental cleaning (disinfect all surfaces) with an EPA-registered disinfectant should be effective in preventing the spread of the organism. McFarland et al. NEJM 1989;320:204.

- In units with high endemic *C. difficile* infection rates or in an outbreak setting, use dilute solutions of 5.25-6.15% sodium hypochlorite (e.g., 1:10 dilution of bleach) for routine disinfection. (Category II)

- For semicritical equipment, glutaraldehyde (20m), OPA (12m) and peracetic acid (12m) reliably kills *C. difficile* spores using normal exposure times.
**Effect of Hydrogen Peroxide Vapor (HPV) on Clostridium difficile (CD)**

- HPV was injected into sealed wards and individual patient rooms using generators until approx 1 micron film of HP was achieved on the surface.
- 5% (8/165) environmental sites cultured before HPV yielded CD compared to none of 155 cultures obtained after HPV.
- HPV was effective in eradicating CD environmental contamination that remained following routine cleaning, which included use of dilute bleach.
- HPV also found effective for MDROs (MRSA, VRE, GNR) in ICU.

Begna, JM and others. Society of Healthcare Epidemiology of America (SHEA), 2006 (abstract 156, page 109); Passaretti and others. SHEA, 2008 (abstract 80, page 10).

---

**Norovirus**
Noroviruses

- Norovirus (formerly Norwalk-like viruses-NLV) is a genus within the family Caliciviridae. SS-RNA with a capsid structure provides increased resistance to chemical disinfection.
- Causes acute gastroenteritis in humans; fecal-oral transmission primarily, although droplet and fomite transmission may facilitate spread.
- Infective dose as low as 10-100 particles.
- Outbreaks have been reported in hospitals, homes, camps, schools, restaurants, hotels, rehabilitation centers and cruise ships
- Outbreaks in hospitals have increased in recent years and this may lead to the closure of wards
- This group of viruses cannot be grown in cell culture so feline calicivirus used as a surrogate

Environmental Contamination
Norovirus

- Hospital-11/36 (31%) environmental swabs were positive for RT-PCR. Positive swabs were from lockers, curtains and commodes and confined to the immediate environment of symptomatic patients. J Hosp Infect 1998;39:39.
- Hotel-61/144 (42%) were positive for NLV RNA. Cheesbrough et al. Epid. Infect. 2000;125:93.
- Rehabilitation Center-Norovirus detected from patients and three environmental specimens (physiotherapy instrument handle, toilet seat (2-room of symptomatic guest, public toilet) RT-PCR. Epid Infect 2002;129:133-138.
- LTCF-5/10 (50%) of the environmental samples were positive for norovirus by RT-PCR. Wu et al. ICHE 2005;26:802.

Some positive PCR results may represent non-infectious virus.
Environmental Survival
Norovirus

- At 20°C a 9-log_{10} reduction of FCV between 21-28 days in a dried state Doutree et al. J Hosp Infect 1999;41:51
- At 20°C a 9-log_{10} reduction of FCV between 14-21 days in suspension Doutree et al. J Hosp Infect 1999;41:51
- At 20°C a 3-log_{10} reduction in infectivity (two animal caliciviruses) occurred in 1 week. Duizer et al. Appl Env Micro 2004;70:4538.

Role of the Environment
Norovirus

1. Prolonged outbreaks on ships suggest NLV survives well
2. Outbreak of GE affected more than 300 people who attended a concert hall over a 5-day period. Norwalk-like virus (NLV) confirmed in fecal samples by RT-PCR. The index case was a concert attendee who vomited in the auditorium. GI illness occurred among members of 8/15 school parties who attended the following day. Disinfection procedure was poor. Evans et al. Epid Infect 2002;129:355
3. Extensive environmental contamination of a hospital ward.
   Suggest transmission most likely occurred through direct contact with contaminated fomites.
### Inactivation of Feline Caliciviruses

Surface Disinfection
Norovirus

- School outbreak of NLV-cleaning with QUAT preparations made no impact on the course of the outbreak. The outbreak stopped after the school closed for 4 days and was cleaned using chlorine-based agents. Marks et al. Epid Inf 2003;131:727
- Detergent-based cleaning to produce a visibly clean surface consistently failed to eliminate norovirus contamination. A hypochlorite/detergent formulation of 5000 ppm chlorine was sufficient to decontaminate surfaces. Barker et al. J Hosp Infect 2004;58:42.

C. difficile and Norovirus

Due to the relative resistance of C. difficile spores and norovirus, during clusters, surfaces should be disinfected with a product shown to be effective (e.g., chlorine 5000ppm [1:10 bleach])
Disinfection and Sterilization: Current Issues and New Technologies

- Disinfection and sterilization principles
- Current issues
  - Critical-cleaning with washer disinfectors, Class 6 chemical indicator, flash sterilization, ozone, ETO, prions
  - Semicritical items—C. difficile spores, laryngoscopes, new AERs/HLDs, endocavitary
  - Noncritical-surface disinfection
    - Accelerated hydrogen peroxide (AHP)
    - Norovirus and C. difficile spores (HP vapor)
    - Microfiber
    - Computers-sustained antimicrobial activity, touchscreen cleaning
    - Germicides-MRSA inactivation by disinfectants, technique
    - Green products

Microfiber Cleaning

- Pad contains fibers (polyester and polyamide) that provide a cleaning surface 40 times greater than conventional string mops
- Proposed advantages: reduce chemical use and disposal (disinfectant solution not changed after every third room, clean microfiber per room [washing lifetime 500-1000x]); light (~5 lb less than string mop) and ergonomic; reduce cleaning times.
- Does the microfiber provide the same or better removal of microorganisms on surfaces?
Effectiveness of Microfiber Mop

- Test conditions with a EPA-registered disinfectant: compared routine mop and bucket; microfiber mop and bucket; microfiber mop and system bucket. Twenty-four replicates per condition.
- Conducted RODAC sampling before and after floor disinfection (5 samples per room)
- New disinfectant solution for each test condition
- Dry time varied from 2 (routine mop and bucket)-8 (microfiber mop and bucket) minutes

Effectiveness of Microfiber Mop
(Rutala, Gergen and Weber, Am J Infect Control, 2007;35:569)

</table>
**Microfiber Summary**

- The microfiber system demonstrated superior microbial removal compared to cotton string mops when used with a detergent cleaner
- The use of a disinfectant did not improve the microbial elimination demonstrated by the microfiber system
- Use of a disinfectant did significantly improve microbial removal when a cotton string mop was used

---

**Disinfection of Computer Keyboards**  
*Computer Keyboards, ICHE 2006;27:372*

- Increased use of computers in patient areas has led to contamination of keyboards as reservoirs of pathogens
- Study performed to
  - Examine the efficacy of different disinfectants on the computer keyboard
  - Determine if there were cosmetic (key lettering removed) or functional changes after 300 wipes
Disinfection of Computer Keyboards

- All tested products were effective (>95%) in removing and/or inactivating the test pathogens (MRSA, *P. aeruginosa*). No functional/cosmetic damage after 300 wipes.
- Disinfectants included: 3 quaternary ammonium compounds, 70% isopropyl alcohol, phenolic, chlorine (80ppm)
- At present, recommend that keyboards be disinfected daily (for 5 sec) and when visibly soiled

---

**Note.** Efficacy was calculated as the percentage difference in the number of colony-forming units on the treated keys, compared with the number of colony-forming units on the control keys. Challenge times are hours since disinfectant exposure.
QUATS demonstrated excellent sustained activity against VRE and antimicrobial activity was maintained over the 48 test period

**Touchscreen Cleaning**

- Follow the manufacturer's recommendations
- Prepare the cleaning solution according to the manufacturer's instructions (e.g., alcohol, glutaraldehyde, mild soap, phenolic)
- Wet a clean, soft cloth with the selected cleaning solution
- Remove excess liquid from the cloth and squeeze damp
- Wipe exposed surfaces (do not allow liquid to enter interior)
- Remove any soap residue by gently wiping with clean cloth
- QUATS are not recommended by some manufacturers
Disinfection and Sterilization: Current Issues and New Technologies

- Disinfection and sterilization principles
- Current issues
  - Critical-cleaning with washer disinfectors, Class 6 chemical indicator, flash sterilization, ozone, VHP, ETO, prions
  - Semicritical items—C. difficile spores, laryngoscopes, new AERs/HLDs, endocavitary

    - Microfiber
    - Computers-sustained antimicrobial activity, touchscreen cleaning
    - Germicides-MRSA inactivation by disinfectants, technique
    - Green products

MRSA
MRSA

- Frequency of environmental contamination in areas housing MRSA patients has ranged from 1 to 74% (23.1%, 53.6% from isolation rooms) of surfaces cultured.
- MRSA viable in the environment for days to weeks
- HCW can contaminate their hands or gloves by touching contaminated surfaces
- Cleaning or disinfecting the environment can reduce transmission but cleaning regimens, as currently practiced, may not eliminate MRSA from surfaces
- Since MRSA sensitive to all germicides, likely due to surfaces not cleaned/disinfected
- Need targeted methods to evaluate the thoroughness of room cleaning

Risk of Acquiring MRSA and VRE from Prior Room Occupants

- Admission to a room previously occupied by an MRSA-positive patient or VRE-positive patient significantly increased the odds of acquisition for MRSA and VRE (although this route is a minor contributor to overall transmission). Arch Intern Med 2006;166:1945.
- Prior environmental contamination, whether measured via environmental cultures or prior room occupancy by VRE-colonized patients, increases the risk of acquisition of VRE. Clin Infect Dis 2008;46:678.

Patient Area Cleaning/Disinfecting
PC Carling et al, SHEA 2007 and ICHE 2008;29:1

- Monitor cleaning performance using an invisible fluorescent targeting method. Rooms (14 high-touch objects) were marked and evaluated after terminal cleaning.
- Results: 1,119 rooms and 13,369 objects were evaluated in 23 hospitals. Mean proportion of objects cleaned was 49%. Following education and process improvement feedback, cleaning improved to 77%
- Conclusion: Substantial opportunity for improving terminal cleaning/disinfecting activities.
Practice * NOT Product

*surfaces not wiped

The Green Hospital

- Hospitals are feeling the pressure to go green, both from eco-conscious donors and governmental agencies
- Some features of The Green Hospital
  - Roof garden-wildlife habitat, adds insulation, absorbs rain
  - Fewer contaminants-upholstery and mattresses without flame retardants, formaldehyde-free insulation, green cleaning products (no hazardous fumes), triple-filtered air
  - Exposure to natural light
  - Reduced water usage-water efficient toilets and faucets
  - Greater energy efficiency-low energy fluorescent bulbs
  - More quiet-number 1 complaint is noise, better insulation between rooms

Currently, “green” cleaners will remove microbial contaminants but will not dependably kill pathogens causing HAIs

Summary

- D/S guidelines must be followed to prevent exposure to pathogens that may lead to infection. Semicritical items represent the greatest risk. Class 6 indicators not a substitute for biological indicators.
- During clusters, surfaces potentially contaminated with norovirus or C. difficile spores should be disinfected with with an agent shown to have efficacy (e.g., hypochlorite, 5000 ppm)
- Microfiber demonstrated superior microbial removal compared to cotton-string mops with a detergent
- Disinfectants (but not “green” products) demonstrate excellent activity against MRSA but practices are deficient. QUATS have sustained antimicrobial activity.
